

What is claimed is:

5 1. An object managing apparatus managing an object used by an application program including one or more components, in a component base that is a base for configuring and executing the application program, comprising:

10 a selecting device selecting an object managing method suitable for a type of a component, from a plurality of object managing methods that are prepared in advance; and

15 a switching device switching in the component base, at least one of an object caching part that caches a persistence object corresponding to data of an external storage using a specified algorithm and an object persistence processing part performing conversion between the data of the external storage and the persistence object, with a part corresponding to the selected object managing method.

20 2. The object managing apparatus according to claim 1, wherein

25 the switching device automatically generates a program of the part corresponding to the selected object managing method, and incorporates the program in the

al

5           the switching device selects the part  
corresponding to the selected object managing method  
from a part group that is prepared in advance, and  
incorporates the selected part in the object managing  
apparatus.

5, The object managing apparatus according to claim  
1, wherein

20 program.

the selecting device includes an input device  
25 inputting usage information of the component, and selects

the object managing method based on the usage information.

5 7. The object managing apparatus according to claim 1, wherein

the switching device has a cache table caching an object for each transaction, and uses an object caching part that registers an object in the cache table after a transaction starts, and clears the cache table when  
10 the transaction terminates, as the part corresponding to the selected object managing method.

8. The object managing apparatus according to claim 1, wherein

15 the switching apparatus has a cache table common to all transactions, and uses an object caching part which does not clear the cache table but makes the other transaction use an object on the cache table when one transaction terminates, as the part corresponding to  
20 the selected object managing method.

9. The object managing apparatus according to claim 1, wherein

the switching device uses an object caching part  
25 that writes data of an object being used by the application

ai

program in the external storage, and sets next data to the object being used, thereby returning the data to the application program when the application program requests acquisition of an object to be processed, as the part corresponding to the selected object managing method.

10. The object managing apparatus according to claim 1, wherein

the switching device uses the object caching part that caches all data of the external storage in advance before the application program requests an object to be processed, as the part corresponding to the selected object managing method.

11. The object managing apparatus according to claim 1, wherein

the switching device uses an object caching part that registers an interface related to the persistence object, and reuses the interface together with the persistence object, as the part corresponding to the selected object managing method.

12. The object managing apparatus according to claim 1, further comprising a designating device designating

one or more data items suitable for the type of the component, wherein

the switching device uses an object persistence processing part that performs conversion between data of the external storage and the persistence object regarding designated data items of the persistence object, as the part corresponding to the selected object managing method.

10 13. An object managing apparatus managing an object used by an application program including one or more components, in a component base that is a base for configuring and executing the application program, comprising:

15 a storing device storing schedule information for selecting an object managing method suitable for a type of a component, from a plurality of object managing methods that are prepared in advance; and

a switching device switching in the component base,  
20 at least one of an object caching part that caches a persistence object corresponding to data of an external storage using a specified algorithm and an object persistence processing part performing conversion between data of the external storage and the persistence object,  
25 with a part corresponding to the suitable object

managing method based on the schedule information.

14. A computer readable recording medium storing a program for a computer that manages an object used by an application program including one or more components, in a component base that is a base for configuring and executing the application program, the stored program causes the computer to perform:

selecting an object managing method suitable for a type of a component, from a plurality of object managing methods that are prepared in advance; and

switching in the component base, at least one of an object caching part that caches a persistence object corresponding to data of an external storage using a specified algorithm and an object persistence processing part performing conversion between data of the external storage and the persistence object, with a part corresponding to the selected object managing method.

15. A managing method managing an object used by an application program including one or more components, in a component base that is a base for configuring and executing the application program, comprising:

preparing a plurality of object managing methods in advance;

A handwritten signature in black ink, appearing to be "R". It consists of a large loop followed by a smaller loop and a short horizontal stroke at the end.

switching in the component base, at least one of

an object caching part that caches a persistence object corresponding to data of an external storage using a specified algorithm and an object persistence processing part performing conversion between data of the external storage and the persistence object, with a part corresponding to the selected object managing method.

17. An object managing apparatus managing an object used by an application program including one or more components, in a component base that is a base for configuring and executing the application program, comprising:

selecting means for selecting an object managing method suitable for a type of a component, from a plurality of object managing methods that are prepared in advance; and

switching means for switching in the component base, at least one of an object caching part that caches a persistence object corresponding to data of an external storage using a specified algorithm and an object persistence processing part performing conversion between the data of the external storage and the persistence object, with a part corresponding to the selected object managing method.
